Registering for Support
Access the erwin support site and click Sign in to register for product support.

Accessing Technical Support
For your convenience, erwin provides easy access to "One Stop" support for all editions of erwin Data Modeler, and includes the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- erwin Support policies and guidelines
- Other helpful resources appropriate for your product

Template Language and Macro Reference

This section contains the following topics

- Introduction
- Metadata Names

Introduction

Template Language (TLX) is the template or macro language publicly exposed with erwin Data Modeler. It has been present in the product since erwin Data Modeler r7.0.

TLX is employed in a number of places in the product using expansion. This includes templates used for forward engineering, metamodel dumps, and Model Explorer and Complete Compare object naming.

Metadata Names

A number of macros make use of class names—the names of metadata objects. The section below describes a few notes on the use of class names; the full listing of all object classes and property classes is located in the document erwin Metamodel Reference bookshelf.

- Class names are always case-sensitive.
- Some object types represent an object in both the logical and the physical model. This is legacy behavior when erwin Data Modeler had only logical/physical models. For these types of objects, display names seen in erwin Data Modeler’s user interface change based upon whether you are looking at the logical or physical side. However, class names do not change in a similar manner. Therefore, an entity in the logical model and a table in the physical model both have a class name of Entity.

The following list describes the class names that are included in this category:

- Attribute
- Default
- Domain
- Entity
- Key_Group
- Relationship
- Validation_Rule

Local User-Defined Properties (UDPs) have three part class names. All UDPs available in the current release are classified as Local UDPs. erwin Data Modeler allows a given UDP name to be used on a variety of object types, and in both the logical and physical model, with differing data types, defaults, descriptions, and so on. For example, the UDP named "Color" might be a color name on the logical side of an entity, a red-green-blue integer on the physical side, and a Boolean value indicating if a view should be colored on reports. To enable erwin Data Modeler to understand exactly what is being referenced, the actual class name is comprised of: <object type>.<model side>.<name>.

For example, the three "Color" values mentioned would be: Entity.Logical.Color, Entity.Physical.Color and View.Physical.Color. Future releases of erwin Data Modeler may also support Global User-Defined Properties where the property has a single data type, default, and so on, no matter where it occurs. Those UDPs will follow the normal naming convention of built-in properties, having a single-part name.
TLX Syntax

The following sections provide a brief review of the TLX syntax.

This section contains the following topics

- Literals
- Macros
- Keywords
- Conditional Blocks
- Propagating Blocks
- Comments

**Literals**

Literal text is enclosed in double quotation marks. This includes literals intended for the final expanded output and literals used as parameters to macros. For example,

"This is a text literal", Property("Name").

The valid characters for a literal include the printing characters (those higher than 32 decimal). Escape sequences are used for some characters. The escape sequences that are currently supported are as follows:

\n
Carriage return

\t

Horizontal tab character

\\n
Back slash

\\

Double quote
One advantage to explicitly-delimited literals is that the formatting of the source and the output can vary. Source text can be formatted exactly as needed because the output text is formatted based upon tabs, spaces, and carriage returns embedded in literals.

**Macros**

Any text not enclosed in double quote marks, and that does not start with an ampersand, is a macro name. For example,

```
MyMacro
```

If parameters are being passed to a macro, they will follow the macro name enclosed in parentheses. If more than one parameter is supplied, they are separated by commas. All parameters are string values.

```
MyMacro("Parameter1", "Parameter2")
```

There are two general classes of macros: substitution and iteration macros.

**Substitution Macros**

Substitution macros evaluate to a string value. A substitution macro takes the form described in the previous section: a macro name and possibly a parameter list. For example,

```
Property("Name")
```

The resulting string may be an empty value if the actual operations performed by the macro are the purpose of the macro. For example, a macro that writes data out to a file might evaluate to an empty string.

**Iteration Macros**

Iteration macros (usually) loop through objects in the model. Iteration macros do not evaluate to string values themselves.

An iteration macro may or may not have parameters, just like a substitution macro, but they are followed by curly braces denoting an iteration block.

```
ForEachOwnee("Attribute")
{
```
Property("Name")
}

The source text inside the iteration block is evaluated once for each time that the iterator increments.

Some iterator macros do not actually traverse objects. For example, they might traverse values on the object. Generally, this type of iterator macro will have special accessor macros that allow these values to be retrieved.

The form of this type of iterator macro is identical. For example:

ForEachProperty
{
ForEachProperty.Value
}

**Macro Return Codes**

When a macro is evaluated, it returns a success code to the TLX template processor. If the macro succeeds, it returns 'true'; if it fails, it returns 'false'.

For a substitution macro, the return code and the string value it evaluates into are not the same thing the macro may evaluate to an empty string and return 'true' to indicate a successful evaluation.

Iterator macros are invoked once before the iteration begins, and then once on each iteration. If the initial invocation fails, no iterations are performed. The looping continues until the macro returns 'false' from a request to increment.

**Keywords**

Unquoted text that starts with an ampersand indicates a keyword. Currently, TLX supports four keywords for conditional control: @if, @ifnot, @elseif and @else. These are not case-sensitive.

These conditional keywords are followed by a block enclosed with curly braces, much like an iteration macro. The code within the block is evaluated only if the condition is true.
@if ( Equal( Property("Name"), "Delaware" ) )
{
"The first state."
}
@elseif( Equal( Property("Name"), "Hawaii" ) )
{
"The last state."
}
@else
{
"A state somewhere in the middle."
}

**Conditional Blocks**

The `@if/@elseif` keywords provide conditional evaluation. An alternate mechanism for conditional behavior is the conditional block. Source text enclosed in square brackets is in a conditional block. A conditional block is emitted only if all macros within it succeed. The block stops evaluating when it encounters a failure.

The choice of whether to use conditional blocks or `@if/@elseif` statements is up to the user—conditional blocks can provide a format that is easier to read than an embedded `@if` block in some situations. For example:

"CREATE TABLE " [Property("DB Owner" "." ) Property("Physical Name")]

Conditional blocks have no effect on enclosing blocks.

**Propagating Blocks**

Source text enclosed in angle brackets is in a propagating block. Propagating blocks essentially have a return code just like a macro does. They succeed if the text within them after evaluation is not empty; they fail otherwise.

In the following example, if we can find a first name or last name on the object, text will emit. If we can find neither, nothing will emit because the propagating block will cause a failure in the outer conditional block. If the propagating block was not used, the literal "My name is" would be emitted even if no name was present.
"My name is"
< " " Property("Name") ] [ " " Property("Last Name") ] >

**Comments**

Text that is enclosed in C-style comments is ignored by the TLX parser and does not become part of the final output.

/* This is a comment */
**TLX Expansion**

This section contains the following topics

*Phantom Objects*

When macros are evaluating, they are generally operating on objects in the model. For example, the Property macro reads the value from a property on the "current" object. This current object is referred to as the context object. Objects become the current object by placing them on the context stack. This is an ordered list that operates in a Last In/First Out manner; objects are added to the list by pushing and removed from the list by popping them.

If you are familiar with erwin Data Modeler's Macro Language, this concept has been present since the earliest days. For example, in erwin Data Modeler r7.2 you could write `%ForEachEntity(E_1)`. This would establish 'E_1' as the current object for subsequent macro calls. Additionally, many macros such as `%JoinFKPK` or `%RelRI` would only operate inside certain iterators or editors. This was because they required a certain context stack to be in existence internally.

This concept is simply being exposed more fully now to provide you more control.

As an illustration, suppose the TLX parser is invoked with an Attribute as the starting object. The context stack would have one entry:

```
Stack
  Attribute
  Current Object
```
Now a macro is used that pushes the Attribute object's owning Entity onto the stack. The stack will now have two entries, with the Entity being the current object.

Now another macro is used that pops the last object from the stack. The stack now reverts to having only the Attribute in it and it is the current object.

Many macros operate upon the current context object. The Property macro is an example of this.
Other macros are capable of operating on objects deeper down the context stack. The PropertyFrom macro is an example of this type.

There are also a variety of macros that push objects onto the context stack and remove them. Macros with the words "Push" and "Pop" in their names are of this variety.

The bottommost (first) object on the stack is known as the anchor object and cannot be popped from the stack. This ensures that macros always have some object as the context. For example, assume that an Entity is the anchor object:

```plaintext
PushOwner /* pushes the model onto the stack */
Pop /* pops the model from the stack */
Pop /* fails - entity is the anchor object */
```

An object can appear in the stack more than once. If the object happens to be the anchor object, only its earliest appearance cannot be popped. Other appearances can be popped at will. For example, assume that an Entity is the anchor object:

```plaintext
PushOwner /* pushes the model onto the stack */
Repush( "1" ) /* pushes entity a second time */
Pop /* pops second occurrence of the entity */
Pop /* pops the model from the stack */
Pop /* fails - entity is the anchor object */
```

Iteration macros that operate on objects implicitly push the current iteration object onto the stack. This frees you from having to write explicit push and pop macro calls. For example, assume that an Entity is the anchor object:

```plaintext
Property("Name") /* <- reads the entity name */
ForEachOwnee("Attribute")
{
  Property("Name") /* <- reads an attribute's name */
}
```
Phantom Objects

In certain processes in erwin Data Modeler, objects that are not actually in the model are simulated so that they can be used by macros. The most notable example of this situation is when evaluating a TLX template for generating an Alter Script. These objects are referred to as phantom objects. Generally, they can be treated exactly like a regular object. However, certain macros behave differently or do not function when the context object is a phantom object. These situations are noted in the macros' descriptions.
Macro Overview

Each macro entry will contain the following sections describing the behavior of the macro and its usage.

This section contains the following topics

Name
Definition
Prototype Specification
Result Specification
Breaking Changes Specification
Categories
Sample

Name

Macro names are always case-sensitive.

The following are some tips on macro names that make it easier to understand their purpose at a glance.

- Macros containing the words "Push" and "Pop" in their names alter the contents of the context stack, such as PushOwner.

- Macros with names ending in "From" will, if necessary, reach beyond the first object in the context stack to find an object of the desired type, such as PropertyFrom.

- Macros with names ending in "Through" will traverse a reference property on the current context object to find the necessary context object, such as PropertyThrough.

- Macros starting with a DBMS name followed by an underscore are designed to work only if the target server matches the DBMS name, such as Access_Datatype.

- Macros with a period in the middle of their name will operate only within the context of a specific iterator, such as.ForEachProperty.IsInherited.

- Macros with a double colon in their name will operate only in certain processes in erwin Data Modeler, such as FE::Bucket.
Definition

This section will provide a description of the macro's behavior, plus any particular notes on using it.

Prototype Specification

The prototype specification of each macro will show the full syntax available. The first term is always the macro's name.

MacroName

Terms in italics represent parameters to the macro. These parameters are described in the table following the prototype signature.

Parameters are always enclosed in parentheses. The parentheses can be omitted if parameters are optional and none are being supplied. Parameters are always separated by commas. Unless otherwise specified, parameters to macros, other than type names, are not case-sensitive.

MacroName( Parameter1, Parameter2 )

Parameters enclosed in square brackets are optional.

MacroName( [OptionalParameter1 [, OptionalParameter2]] )

If a macro can take a variable length list of parameters, it will be indicated by an ellipsis.

MacroName( Value1[, Value2 [, ...]] )

Iterator macros are indicated by a trailing set of curly braces.

MacroName( Parameter1 ){}
As the software evolves, some macros may become deprecated. The deprecation specification indicates the level of deprecation at the time of documentation. The following describes the possible values and their meaning:

**Active**

The macro is not deprecated in any way.

**Discouraged**

The macro has been replaced by an alternate macro. You may switch to the new syntax when editing new code in order to take advantage of new capabilities or faster performance.

Macros in this status are fully supported and there is no intention to remove them from the product. However, they may not run as efficiently as other approaches and/or may not have the same features available.

** Deprecated**

The macro is deprecated and support for it will eventually be removed from the product.

**Removed**

The macro is no longer supported and will not function in the software.

**Breaking Changes Specification**

This section will describe ways in which the macro has changed from previous versions when that change would break existing code. Generally, breaking changes are adjusted by the post-load processors when a model is upgraded to a new version of the software. The description of the breaking change is provided so that you can adjust any new code you write.

**Categories**

This is the list of categories to which this macro is assigned by erwin Data Modeler. You can add the macro to more categories, if you choose, by using the Macro Categories editor.
Sample

An example of using the macro will be provided in this subsection.
Standard Macros

This set comprises the bulk of the new macros in erwin Data Modeler. They are usable in all, or almost all, processes in the product.

This section contains the following topics

**Access_DatabaseName**

**Description**

This macro evaluates to the database name for an Access target server.

**Prototype**

```
Access_DatabaseName
```

**Result**

This macro will fail in the following circumstances:

- The target database is not Access.

**Deprecation Level**

Active
Breaking Changes
None

Categories
- DBMS Specific Macros

Sample

Template

"Set ERwinDatabase = ERwinWorkspace.OpenDatabase("Access_DatabaseName ")"

Result

Set ERwinDatabase = ERwinWorkspace.OpenDatabase("sERwinDatabase")

**Access_Datatype**

Description

This macro converts the erwin Data Modeler data type to a constant usable by an Access database.

Prototype

Access_Datatype

Result

This macro will fail in the following circumstances:
- The target database is not Access.

Deprecation Level

Active

Breaking Changes
None

Categories
DBMS Specific Macros

Sample

Assume the current context is the Attribute object E_1.a in the following illustration:

```
E_1

a: integer

b: char (18)
```

Template

"Set ERwinField = ERwinTableDef.CreateField(" \\
"" Property("Physical_Name") \\
"," Access_Datatype ")"

Result

Set ERwinField = ERwinTableDef.CreateField("a", DB_INTEGER)

AllowAlterDatatype

Description

This macro determines if a change in an attribute's data type can be handled via an alter script.

Prototype

AllowAlterDatatype

Result

This macro will fail in the following circumstances:

- The database does not support alter for the data type change.

Deprecation Level
Active

Breaking Changes

None

Categories

Alter Macros

Sample

Assume the current context is an attribute whose datatype has been changed from smallint to integer.

**Template**

```
[ AllowAlterDatatype
  "This can be altered"
]
```

**Result**

This can be altered

**AreAllOwneesCreated**

**Description**

This macro determines if all objects of the specified type that are owned by the current context object have been created in the current session.

**Prototype**

```
AreAllOwneesCreated( OwneeType [, Option1 [, OptionN [, ...]]] )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OwneeType</td>
<td>Req</td>
<td>The type of owned object to test.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The options available are found in the following table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;reverse&quot;</td>
<td>If this option is present, the macro will fail if all ownees of the specified type are created in the current session.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- There exists an object of the specified type owned by the context object that was not created in the current session.
- All ownees of the specified type were created in the current session and the reverse option was present.
- No objects of the specified type are owned by the context object.

Deprecation Level

- Alter Macros

Sample

Assume the current context is a key group that had all members deleted.

**Template**

```plaintext
[  /* This makes sure at least one was present before */  AreAllOwneesCreated("Key Group Member", "reverse")  /* This makes sure none are left */
```
AreAllOwneesDeleted("Key Group Member")
"Emit a DROP statement"

Result
Emit a DROP statement

AreAllOwneesDeleted

Description
This macro determines if all objects of the specified type that are owned by the current model have been deleted in the current session.

Prototype
AreAllOwneesDeleted( OwneeType [, Option1 [, OptionN [...]]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OwneeType</td>
<td>Req</td>
<td>The type of owned object to test.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"reverse"

    If this option is present, the macro will fail if all ownees of the specified type are created in the current session.

Result
This macro will fail in the following circumstances:

- The required parameters are not passed in.
- There exists an object of the specified type owned by the context object.
- At least one object of the specified type owned by the context object does not appear in the list of objects deleted in the current session.

Deprecation Level

Sample

Assume the current context is a key group that had all members deleted.

Template

[ /* This makes sure at least one was present before */
  AreAllOwnneesCreated("Key Group Member", "reverse")
  /* This makes sure none are left */
  AreAllOwnneesDeleted("Key Group Member")
  "Emit a DROP statement"
]

Result

Emit a DROP statement

**AreStringsEqual**

Description

This determines if one string is equal to another.

Prototype

AreStringsEqual( LeftString, RightString [, Option] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeftString</td>
<td>Req</td>
<td>The left string in the test.</td>
</tr>
<tr>
<td>RightString</td>
<td>Req</td>
<td>The right string in the test.</td>
</tr>
</tbody>
</table>
Option Opt

By default the comparison is case-sensitive. If this parameter is set to "NoCase" the comparison will be done in a case-insensitive manner. The word "NoCase" is not case sensitive.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The two strings are not equal.

Deprecation Level

Deprecated

The Equal macro should be used.

Breaking Changes

None

Categories

- String Macros

Sample

Template

Set("Value1", "aaa")
Set("Value2", "bbb")
@if( AreStringsEqual( Value("Value1"), Value("Value2") ) )
{
"Yes"
}
%else
{
"No"
}

Result

No
**Choose**

Description

This macro, in conjunction with the *Switch* and *Default* macros, tests a predicate against a range of values and executes a block when a match is found.

The block associated with this macro will be evaluated if the predicate matches and no previous *Choose* or *Default* blocks have evaluated successfully.

Prototype

Choose( Value ) {}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Req</td>
<td>The predicate of the Switch macro will be tested against this value.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Deprecation Level

- Miscellaneous Macros

Sample

Assume the context is the primary key of an entity.

**Template**
Switch( Left( Property("Key_Group_Type"), "2" ) )
{
Choose( "PK" )
{
"This is a primary key."
}
Choose( "AK" )
{
"This is an alternate key."
}
Default
{
"This is an inversion entry."
}
Choose( "XX" )
{
/* This block will never execute, because a preceding block
will always evaluate successfully due to the presence of the
Default macro. */
}
}

Result
This is a primary key.

ClearAllGlobalFlags

Description
This clears all flags set with SetGlobalFlag.

Prototype
ClearAllGlobalFlags

Result
This macro always succeeds.

Deprecation Level
Active

Breaking Changes
None

Categories
- Stack Macros

Sample

**Template**

SetGlobalFlag("Flag1")
SetGlobalFlag("Flag2")
@if( IsGlobalFlagSet("Flag1") )
{
"Flag1 is set."
}
@if( IsGlobalFlagSet("Flag2") )
{
"Flag2 is set."
}
ClearAllGlobalFlags
@if( IsGlobalFlagSet("Flag1") )
{
"Flag1 is still set."
}
@if( IsGlobalFlagSet("Flag2") )
{
"Flag2 is still set."
}

**Result**

Flag1 is set.
Flag2 is set.

**ClearGlobalFlag**

**Description**
This clears the named global flag set with \textit{SetGlobalFlag}.

Prototype

\begin{verbatim}
ClearGlobalFlag( Flag )
\end{verbatim}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flag</td>

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.

Deprecation Level

Active

Breaking Changes

None

Categories

- Stack Macros

Sample

\textbf{Template}

\begin{verbatim}
SetGlobalFlag("Flag1")
SetGlobalFlag("Flag2")
@if( IsGlobalFlagSet("Flag1") )
{
 "Flag1 is set.\n"
}
@if( IsGlobalFlagSet("Flag2") )
{
 "Flag2 is set.\n"
}
ClearGlobalFlag("Flag1")
\end{verbatim}
@if( IsGlobalFlagSet("Flag1") )
{
"Flag1 is still set.\n"
}
@if( IsGlobalFlagSet("Flag2") )
{
"Flag2 is still set."
}

Result
Flag1 is set.
Flag2 is set.
Flag2 is still set.

**ClearLocalFlag**

Description
This clears the named global flag set with *SetLocalFlag*.

Prototype

```
ClearLocalFlag( Flag [ , Depth ] )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Flag</em></td>
<td>Req</td>
<td>The name of the flag to clear.</td>
</tr>
<tr>
<td><em>Depth</em></td>
<td>Opt</td>
<td>This will clear the named local flag from the stack entry <em>Depth</em> levels above the current entry.</td>
</tr>
</tbody>
</table>

Result
This macro will fail in the following circumstances:

- The required parameters are not supplied.

Deprecation Level

@ifnot( IsLocalFlagSet("Flag2") )
{
"Flag2 was cleared."
}
Pop
@ifnot( IsLocalFlagSet("Flag1") )
{
"Flag1 was cleared."
}

**Result**

Flag2 was cleared.
Flag1 was cleared.

**ConversionFunction**

**Description**

This macro prompts you for a conversion function for a column data type change. This occurs when the Alter Script processing determines that it will drop and recreate the table.

**Prototype**

ConversionFunction

**Result**
This macro will fail in the following circumstances:

- An appropriate conversion function cannot be determined.

Deprecation Level
Active

Breaking Changes
None

Categories
- Alter Macros

Sample

Assume that a table was modified from the left illustration to the right illustration.

<table>
<thead>
<tr>
<th>E_1</th>
<th>E_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>a: char (18)</td>
<td>a: char (18)</td>
</tr>
<tr>
<td>b: char (18)</td>
<td>b: integer</td>
</tr>
</tbody>
</table>

If you ran the Alter Script process, pressed Preview and then Save Data, they would see a dialog something like the following.

**DatabaseConnection**

Description

This evaluates to one of the connection information strings

Prototype

DatabaseConnection( Option )
The options available are found in the following table. These terms are not case-sensitive.

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;database&quot;</td>
<td>The database name</td>
</tr>
<tr>
<td>&quot;server&quot;</td>
<td>The server name</td>
</tr>
<tr>
<td>&quot;user&quot;</td>
<td>The user name</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameter is not supplied.

Deprecation Level

Active

Breaking Changes

None

Categories

None.

Sample

**Template**

DatabaseConnection( "user" )

**Result**

my_user_name

**Date**

Description
This evaluates to the current time stamp.

Prototype

Date( [Format] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>Opt</td>
<td>This may be either a format string as specified in the table below or the word &quot;System&quot;. If the latter is supplied, the format string held by the operating system for the current locale is used. If no parameter is supplied, the default string used is: &quot;%d %b %Y %I:%M:%S %p&quot;</td>
</tr>
</tbody>
</table>

The format string consists of a series of specifiers that indicate a component of a full date/time value, plus the formatting for that value. For full documentation of all of the formatting options available, the documentation for the C Runtime function strftime() function should be consulted. This documentation can be located on the Web at a number of sites, one example of which is: http://msdn2.microsoft.com/en-US/library/fe06s4ak.aspx.

The following provides an overview of some of the more common specifiers.

%a
Abbreviated weekday name.

%A
Full weekday name.

%b
Abbreviated month name.

%B
Full month name.

%c
Date and time representation appropriate for locale.

%#c
Long date and time representation, appropriate for current locale. For example: "Tuesday, March 14, 1995, 12:41:29".

%d
Day of month as a decimal number (01 31). If a # sign is inserted after the % sign, leading zeros are suppressed.

%H
Hour in 24-hour format (00 23). If a # sign is inserted after the % sign, leading zeros are suppressed.

%I
Hour in 12-hour format (01 12). If a # sign is inserted after the % sign, leading zeros are suppressed.

%j
Day of year as a decimal number (001 366). If a # sign is inserted after the % sign, leading zeros are suppressed.

%m
Month as a decimal number (01 12). If a # sign is inserted after the % sign, leading zeros are suppressed.

%M
Minute as a decimal number (00 59). If a # sign is inserted after the % sign, leading zeros are suppressed.

%p
Current locale's AM/PM indicator for a 12-hour clock.

%S
Second as decimal number (00 59). If a # sign is inserted after the % sign, leading zeros are suppressed.

%U
Week of year as decimal number, with Sunday as first day of week (00 53). If a #
sign is inserted after the % sign, leading zeros are suppressed.

%%w
Weekday as decimal number (0 6; Sunday is 0). If a # sign is inserted after the % sign, leading zeros are suppressed.

%%W
Week of year as decimal number, with Monday as first day of week (00 53). If a # sign is inserted after the % sign, leading zeros are suppressed.

%%x
Date representation for current locale.

%%#x
Long date representation, appropriate to current locale. For example: "Tuesday, March 14, 1995".

%%X
Time representation for current locale.

%%y
Year without century as a decimal number (00 99). If a # sign is inserted after the % sign, leading zeros are suppressed.

%%Y
Year with century as a decimal number. If a # sign is inserted after the % sign, leading zeros are suppressed.

%%z, %%Z
Either the time-zone name or time zone abbreviation, depending on registry settings. No characters if time zone is unknown.

Result
This macro always succeeds.

Date("system") "\n"
Date("%b %d, %Y")

**Result**

03 Oct 2006 02:01:24 PM
Tuesday, October 03, 2006
Oct 03, 2006

**DBMSVersion**

Description

This macro determines if the version of the database specified for the current model falls into a specific range. Version numbers should be specified in the format:

\(<Major Version Number>\;<Minor Version Number>\)

If no minor version is specified, then it is assumed to be zero.

Prototype

DBMSVersion( StartVersion [, StopVersion] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Version</td>
<td>Req</td>
<td>This identifies the lowest acceptable version number.</td>
</tr>
<tr>
<td>Stop Version</td>
<td>Opt</td>
<td>This identifies the highest acceptable version number. If this value is not supplied, only the lower version is tested.</td>
</tr>
</tbody>
</table>
Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The model has not target database set.
- The specified parameters cannot be parsed.
- The version of the database on the model is outside the specified range.

Deprecation Level

Active

**Categories**

- Miscellaneous Macros

**Sample**
Assume the context is an inversion entry of an entity.

Template

Switch( Left( Property("Key_Group_Type"), "2" ) )
{
  Choose( "PK" )
  {
    "This is a primary key."
  }
  Choose( "AK" )
  {
    "This is an alternate key."
  }
  Default
  {
    "This is an inversion entry."
  }
  Choose( "XX" )
  {
    "/* This block will never execute, because a preceding block will always evaluate successfully */"
  }
}

Result

This is an inversion entry.

EnumProperty

Description

This is a lookup macro that evaluates to a specified string based upon a zero-based integer value contained in a property of the current context object. The integer values are assumed to be in a contiguous range starting at zero and positive in value.

Prototype

EnumProperty( Property, Value0 [, Value1 [, ...]] )
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Req</td>
<td>The property to examine.</td>
</tr>
<tr>
<td>Value0</td>
<td>Req</td>
<td>The value to return if the property has the value of '0'.</td>
</tr>
<tr>
<td>Value1</td>
<td>ValueN</td>
<td>Opt</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The specified property does not exist or it has a null value.
- The list of replacement strings is not large enough to accommodate the value found in the property.

Deprecation Level

Sample

Assume the context is the table in the following illustration and the target type is Access.

```
E_1
```

```
<table>
<thead>
<tr>
<th>a: char (18) NOT NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>b: char (18) NULL</td>
</tr>
</tbody>
</table>
```
**Template**

ForEachOwnee("Attribute")
{
EnumProperty( "Null_Option_Type", "NULL", "NOT NULL" ) "\n"
}

**Result**

NOT NULL
NULL

**EnumProperty2**

**Description**

This is a lookup macro that evaluates to a specified string based upon a zero-based integer value contained in a property of the current context object. The values in the property are offset from zero by the amount specified in Offset. For example, if the value of Offset is '10', then the first string will correspond to a property value of '10', the second to the value '11' and so on. The integer values are assumed to be in a contiguous range and result in positive values once the offset is applied.

**Prototype**

EnumProperty2( Property, Offset, Value0 [, Value1 [, ...]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Req</td>
<td>The property to examine.</td>
</tr>
<tr>
<td>Offset</td>
<td>Req</td>
<td>The amount to offset the value in the property.</td>
</tr>
<tr>
<td>Value0</td>
<td>Req</td>
<td>The value to return if the property has the adjusted value of '0'.</td>
</tr>
<tr>
<td>Value1</td>
<td>ValueN</td>
<td>Opt The value(s) to return if the property has the adjusted value of '1' to 'N'.</td>
</tr>
</tbody>
</table>

**Result**

This macro will fail in the following circumstances:
- The required parameters are not passed in.
- The specified property does not exist or it has a null value.
- The list of replacement strings is not large enough to accommodate the value found in the property.

}@else
{
"Name is not exactly 'e_1'.\n"
}@if( Equal(Property("Name"), "e_1", "no_case") )
{
"Name is case-insensitively like 'e_1'."
}

Result
Name is not exactly 'e_1'.
Name is case-insensitively like 'e_1'.

**Execute**

**Description**

This macro allows a piece of named template code to be reused. It will load a named template from a template file and expand it in the current context.

**Note:** This macro will work only in processes that make use of named templates and template files. Currently, these are Schema Generation (Forward Engineering) and Alter Script Generation. More information on template files can be found in the document *Editing Forward Engineering Templates.pdf*.

If the *FileName* parameter is not supplied, the macro looks for the template in the current template file. The current template file is the initial file bound to the TLX engine by the erwin Data Modeler process being run.

If the *FileName* parameter is supplied, the macro looks for the template in the specified file.

**Prototype**

Execute( NamedTemplate [, FileName [, Param1 [, Param2 [, ...]]]] )
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NamedTemplate</td>
<td>Req</td>
<td>This is the name of the template entry in the file.</td>
</tr>
<tr>
<td>FileName</td>
<td>Opt</td>
<td>This is the name of the template file containing the entry, if it is not the current file. An empty string also indicates the current file. If the specified file does not contain a path specification, the file is assumed to be in the same location as the current template file.</td>
</tr>
<tr>
<td>Param1, ParamN</td>
<td>Opt</td>
<td>Parameters to the executed template. The template being invoked can contain replacement tokens. Param1 will be substituted for %1, Param2 will be substituted for %2, and so on.</td>

"CREATE TABLE " Property("Name") "\n"\n"
ForEachOwnee("Attribute")
{
ListSeparator("","\n")
"\t" Execute("Clause: Column Properties")
}
"
SPIItemEnd
SPIItemBegin = Clause: Column Properties
Property("Physical_Name") " " Property("Physical_Data_Type")
SPIItemEnd

Result
CREATE TABLE E_1
{
a INTEGER,
b CHAR(18)
}

ExecuteTest

Description
This macro allows a piece of named template code to be reused. It will load a named template from a template file and expand it in the current context. If the result expands to the text *Success*, the macro will succeed. Otherwise, it will fail.

**Note:** This macro will work only in processes that make use of named templates and template files. Currently, these are Schema Generation (Forward Engineering) and Alter Script Generation. More information on template files can be found in the document *Editing Forward Engineering Templates.pdf*.

If the *FileName* parameter is not supplied, the macro looks for the template in the current template file. The current template file is the initial file bound to the TLX engine by the erwin Data Modeler process being run.

If the *FileName* parameter is supplied, the macro looks for the template in the specified file.

**Prototype**

```
ExecuteTest( NamedTemplate [, FileName [, Param1 [, Param2 [,...]]]] )
```

<table>

Assume the following model and the foreign key in \( E_2 \) is the context object:

```
Template
ForEachMigratingColumn
{
  PushOwner Property("Name") Pop "." Property("Name") "\n"
}

Result

E_1.a
E_1.b
E_1.c

ForEachOfType

Description

This iterates across the instances of a specific type of object.

Prototype

ForEachOfType( TypeName [, Category] ){}
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TypeName</strong></td>
<td>Req</td>
<td>The type of object to traverse.</td>
</tr>
<tr>
<td><strong>Category</strong></td>
<td>Opt</td>
<td>A filter on what type of objects should be returned. If this value is not specified, &quot;active&quot; is assumed.</td>
</tr>
</tbody>
</table>

The **Category** values available are found in the following.

- **"active"**
  
  Only actual, non-phantom objects of the specified type are returned.

- **"deleted"**
  
  Only phantom objects representing deleted objects of the specified type are returned.

- **"modified"**
  
  Only phantom objects representing the pre-image of modified objects of the specified type are returned.

- **"phantom"**
  
  Only phantom objects, both deleted and modified, of the specified type are returned.

- **"all"**
  
  All phantom and non-phantom objects of the specified type are returned.

**Result**

This macro succeeds.

**Deprecation Level**

Iterator Macros

Sample
Assume a model that, when loaded, had three Entity objects: E_1, E_2 and E_3. Assume E_2 was deleted, E_3 was renamed to New_3, and E_4 was created.

**Template**

"Active entities: 
ForEachOfType("Entity")
{
ListSeparator("", "")
Property("Name")
}
"\nDeleted entities: 
ForEachOfType("Entity", "deleted")
{
ListSeparator("", "")
Property("Name")
}
"\nModified entities: 
ForEachOfType("Entity", "modified")
{
ListSeparator("", "")
Property("Name")
}

**Result**

Active entities: E_1, New_3, E_4
Deleted entities: E_2
Modified entities: E_3

**ForEachOwnee**

**Description**

This iterates across the ownee list of the current context object.

When the current context object is a phantom object representing the old state of a modified object, the ownees reported will be those present in the old state, not the current set of ownees.

**Prototype**
ForEachOwnee( [TypeName [, SortBy [, Option1 [, Option2 [,...]]]]] )
{}  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypeName</td>
<td>Opt</td>
<td>If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.</td>
</tr>
<tr>
<td>SortProperty</td>
<td>Opt</td>
<td>The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place and the objects will appear in whatever internal order is held in erwin Data Modeler.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following.

"owner_sort"

If this option is present, SortProperty is assumed to be found on the owning (context) object and to be in the form of a vector of ownee ids. If the owning object does not have the specified property, no sorting will take place. If this is not present, the property is assumed to be found on the ownee objects and they will be sorted based upon its value.

"reverse_sort"

If this option is present, the sorting will be reversed.

"require_one"

If this option is present, at least one iteration must occur or the macro will fail.

Result

This macro always succeeds.

▪ Iterator Macros

Sample

Assume the context is the table in the following illustration, which is shown in the Physical Order display level:

![Table Illustration]

**Template**

ForEachOwnee("Attribute", "Physical_Columns_Order_Ref", "owner_sort")
{
  Property("Physical_Name") "\n"
}
"\n"
ForEachOwnee("Attribute", "Name")
{
  Property("Physical_Name") "\n"
}

**Result**

b
a
a
b
**ForEachOwneeFrom**

**Description**

This iterates across the ownee list on the first object in the context stack with the specified type.

**Prototype**

```plaintext
ForEachOwneeFrom( ContextType [, TypeName [, SortBy [, Option1 [, Option2 [,...]]]]] ){}
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextType</td>
<td>Req</td>
<td>The type of object to locate on the context stack.</td>
</tr>
<tr>
<td>TypeName</td>
<td>Opt</td>
<td>If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.</td>
</tr>
<tr>
<td>SortProperty</td>
<td>Opt</td>
<td>The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place and the objects will appear in whatever internal order is held in erwin Data Modeler.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
</tbody>
</table>

**Result**

This macro will fail in the following circumstances:

- The current object is a phantom object.
- An object of that type does not exist on the context stack.

**Deprecation Level**

Active

**Breaking Changes**

None
Categories

- Iterator Macros

Sample

To illustrate the difference between this and the *ForEachOwnee* macro, assume that context object is E_1 in the following illustration

When the following template code is expanded, both loops produce the same result because an Entity object is current on the stack.

```
Template
ForEachOwnee("Attribute")
{
  Property("Physical_Name") "\n"
}
```
ForEachOwneeFrom("Entity", "Attribute")
{
    Property("Physical_Name") "\n"
}

Result

a
b
a
b

However, if we introduce other objects onto the context stack, the behavior of the two iterators changes. For example, if we introduce Relationship onto the stack above the Entity, using the `ForEachReference` macro, the stack will appear as follows:

```
Stack
  Relationship
  Entity
```

Since Relationship objects don’t own Attribute objects, the first iterator will not traverse any objects. The second iterator will still locate the Entity object and traverse its ownees.

Template

```
ForEachReference("Parent_Relationships_Ref")
{
    ForEachOwnee("Attribute")
    {
        Property("Physical_Name") "\n"
    }
    "\n"
```
ForEachOwneeFrom("Entity", "Attribute")
{
    Property("Physical_Name") "\n"
}

Result
a
b

**ForEachOwneeThrough**

Description

This iterates across the ownee list on the object pointed to by the specified scalar reference property on the current context object.

Prototype

ForEachOwneeThrough( ReferenceProperty [, TypeName [, SortBy [, Option1 [, Option2 [, ...]]]]]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReferenceProperty</td>
<td>Req</td>
<td>The reference property to use to locate the desired owning object.</td>
</tr>
<tr>
<td>TypeName</td>
<td>Opt</td>
<td>If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.</td>
</tr>
<tr>
<td>SortProperty</td>
<td>Opt</td>
<td>The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place.</td>
</tr>
<tr>
<td>Option1 OptionN</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
</tbody>
</table>

The options available are found in the following.

"owner_sort"
If this option is present, SortProperty is assumed to be found on the owning (context) object and to be in the form of a vector of ownee ids. If the owning object does not have the specified property, no sorting will take place. If this is not present, the property is assumed to be found on the ownee objects and they will be sorted based upon its value.

"reverse_sort"

If this option is present, the sorting will be reversed.

"require_one"

If this option is present, at least one iteration must occur or the macro will fail.

Result

This macro will fail in the following circumstances:

- The current object is a phantom object.
- The reference property does not exist.

a

b

**ForEachProperty**

Description

This is a special-purpose macro generally used in components that produce dumps of models. It will iterate across the properties of an object. Special sub-macros are then available to retrieve information about the property.

The context object is not changed by this iterator.

Prototype

ForEachProperty( [Option1 [, Option2 [, ...]]] ){}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option1</td>
<td>OptionN</td>
<td>Opt</td>
</tr>
</tbody>
</table>

The options available are found in the following table. These terms are not case-sensitive.
"type_sort"
   The properties will be sorted by their type.

"all"
   Pass all types of properties. This is the default setting and will override conflicting options.

"user_defined"
   Pass only user-defined properties.

"built_in"
   Pass only built-in properties.

Result

This macro will fail in the following circumstances:
   - The context object is a phantom object.

Deprecation Level

Active

Breaking Changes

None

Categories
   - Iterator Macros

Sample

Assume that the current context is the M1 object Domain (the object defining the metadata for Domain instances in the model) and we want to see what tags are applied to it.

Template

/* List the tags, putting inherited ones in HTML italics */
ForEachProperty("user_defined", "types_sort")
{
   [ForEachProperty.IsInherited "<i>"]
ForEachProperty.Type
[ForEachProperty.IsInherited "</i>" ] "="
ForEachProperty.Value "\n"
}

Result

<i>HasUdpEditor</i>=true
<i>IsExplorerSuppressed</i>=true
IsLogical=true
Is_Physical=true
Legacy_MM_Order=7
Physical_Name=Domain

**ForEachProperty.IsInherited**

Description

This is a special-purpose macro that is usable only inside of a *ForEachProperty* iterator, and then only when the context object is an M1 (metadata) object.

It will indicate if the property was defined on the context object or inherited from a parent M1 object.

Prototype

ForEachProperty.IsInherited

Result

This macro will fail in the following circumstances:

- It is not executed inside the proper containing iterator.
- The property is not inherited.

Categories

- Iterator Macros

Sample

See the example under the *ForEachProperty* macro.
**ForEachPropertyValue**

Description

This iterates across the values present in the specified property on the current context object.

The context object is not changed by this iterator.

Prototype

```plaintext
ForEachProperty( Property [, Option1 [, ...]] ){}
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Option1, OptionN</td>
<td>Opt</td>
<td>One or more option keywords. These can appear in any order.</td>
</tr>
</tbody>
</table>

The options available are found in the following table. These terms are not case-sensitive.

"**new_only**"

On a modified object, only traverse the new values.

"**old_only**"

On a modified object, only traverse the old values.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The context object is a phantom object.

Deprecation Level

Active

Breaking Changes

None
Categories

- Iterator Macros

Sample

The following example traverses the old and new values of a *Partition* object, merging the old values and splitting out the new values.

Template

```plaintext
IsPropertyModified( "Partition_Values" )
[
ForEachPropertyValue( "Partition_Values", "old_only" )
{
"ALTER PARTITION FUNCTION " Property( "Name" ) "() "
"\nMERGE RANGE (" ForEachPropertyValue.Value ")"
FE::EndOfStatement
}
]
[
ForEachPropertyValue( "Partition_Values", "new_only" )
{
"ALTER PARTITION FUNCTION " Property( "Name" ) "() "
"\nSPLIT RANGE (" ForEachPropertyValue.Value ")"
FE::EndOfStatement
}
]
```

**ForEachPropertyValue.Value**

Description

This is a special-purpose macro that is usable only inside of a ForEachProperty iterator, and then only when the context object is an M1 (metadata) object.

It will evaluate to the value of the property.

This macro will fail if:

- It is not executed inside the proper containing iterator.
Prototype

ForEachPropertyValue.Value

Result

This macro always succeeds.

Deprecation Level

Active

Breaking Changes

None

Categories

**ForEachReference**

Description

This iterates across the objects listed in the specified property on the current context object.

Prototype

ForEachReference( Property, [Option1 [, Option2 [, ...]]])

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Option1</td>
<td>OptionN</td>
<td>One or more option keywords. These can appear in any order.</td>
</tr>
</tbody>
</table>

The options available are found in the following table.
The objects will be sorted according to the 'Name' property in ascending order.

"flatten"

When the context objects exist in the M1 (metadata) layer of the model this option will cause the values on parent objects to be pushed down to the child objects. Do not use this when the macro is employed in the context of an M0 (data) model as unpredictable results will occur.

"exact"

This will cause the vector of references to be traversed exactly as they are found. Normally, duplicates are suppressed; this changes that behavior. This option will cause the "name_sort" and "flatten" options to be ignored, if they are specified.

Result

This macro will fail in the following circumstances:

- The specified parameters are not provided.
- The specified property is not found on the context object.

Entity - E_2
Drawing Object Relationship - R/1
Key Group - XIF1E/2
Attribute - a

ForEachUserDefinedProperty

Description
This will iterate across the user-defined properties of an object. Special sub-macros are then available to retrieve information about the property.
The context object is not changed by this iterator.

Prototype
ForEachUserProperty( [Option1 [, Option2 [, ...]]] ){}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. These can appear in any order.</td>
</tr>
</tbody>
</table>

The options available are found in the following table. These terms are not case-sensitive.
"all"
   Pass all user-defined properties. This is the same as passing no parameter.
"database"
   Pass user-defined properties having the Is_Database_Property tag set.
"logical"
   Pass user-defined properties having the Is_Logical tag set.
"physical"
   Pass user-defined properties having the Is_Physical tag set.

Result
This macro will fail in the following circumstances:
The context object is a phantom object.

Deprecation Level
Active

Breaking Changes
None

Categories
- Iterator Macros

Sample
Assume that the current context is the Model with a UDP named "Foo" set on the logical side and a UDP named "Bar" set on the physical side.

**Template**

"All UDPS\n"
ForEachUserDefinedProperty
{
\"\t\" userDefinedProperty.PropertyType\n}

"\nLogical UDPs\n"
ForEachUserDefinedProperty( "logical" )
{
 "\t" ForEachUserDefinedProperty.Type "\n"
}

**Result**

All UDPs
Model.Logical.foo
Model.Physical.bar
Logical UDPs
Model.Logical.foo

**FormatProperty**

**Description**

This macro evaluates to a formatted representation of the specified property on the current context object. A property is identified by its class name as defined in the metadata for erwin Data Modeler.

**Prototype**

Property( PropertyName [, Option1 [, Option2 [, ...]]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

**-d:<value>**

This specifies the delimiter that will be inserted between individual values in a vector property. If this option is not supplied, or <value> is empty, a comma will be used.

**-b:<value>**
This specifies the bracketing characters for each value in the property. If <value> is one character, it will be applied as an opening and closing bracket. If <value> is two characters, the first character will be applied as an opening bracket and the second character as a closing bracket.

-p:<value>
If the property is a reference property, this option will cause the property specified by <value> to be read on the referenced object. If this value is not supplied, or the property cannot be evaluated, the raw reference value will be used.

"no_load"
By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.

"fail_if_empty"
If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result
This macro will fail in the following circumstances:
- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.

Deprecation Level
Active
Breaking Changes
None.
Categories
- Property Macros

Sample
Assume the current context object is a subject area containing the tables in the following illustration:

```
Template
FormatProperty("Referenced_Entities_Ref", "d:", "b:\", "p:Name")
/* Which would be the same as... */ "\n\n"
ForEachReference("Referenced_Entities_Ref")
{
ListSeparator("","")
"\\" Property("Name") "\\"
}
Result
"E_1","E_2"
"E_1","E_2"

**Greater**

Description

This determines if one value is greater than another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

"123"
Prototype

Greater( LeftString, RightString [, Option1 [, Option2 [, ...]]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeftString</td>
<td>Req</td>
<td>The left value in the test.</td>
</tr>
<tr>
<td>RightString</td>
<td>Req</td>
<td>The right value in the test.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"ascii"

By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9".

If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".

"no_case"

If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not greater than the second.

</table>

The options available are found in the following table.

ascii"

By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9".
If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".

"no_case"

If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not greater than or equal to the second.

Deprecation Level

Active

Breaking Changes

None

Categories

- String Macros

Sample

Template

Set("Value1", "11")
Set("Value2", "9")
@if( GreaterOrEqual( Value("Value1"), Value("Value2") ) )
{
"Greater or equal on a numeric sort\n"
}
@else
{
"Less on a numeric sort\n"
}
@if( GreaterOrEqual( Value("Value1"), Value("Value2"), "ascii" )

100
{ "Greater or equal on an ASCII sort\n" } @else { "Less on an ASCII sort\n" }

**Result**

Greater or equal on a numeric sort
Less on an ASCII sort

**HasOwnees**

**Description**

This will determine if the current context object has ownees of a given type.

**Prototype**

HasOwnees( [Type] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Opt</td>
<td>The type of the ownee desired. If not type is specified, then the macro will succeed if the object has any ownees.</td>
</tr>
</tbody>
</table>

**Result**

This macro will fail in the following circumstances:

- There is no context object.
- There are no ownees of the specified type.

**Deprecation Level**

Active

**Breaking Changes**

None
Assume the current context is a Key_Group.

Template

```c
/* Only emit something if the key group has members. */
[HasOwnees( Key_Group_Member )
...
]
```

**HasPropertyCharacteristic**

Description

This determines if the specified property on the current context object has the specified characteristic.

If this macro is invoked against a phantom object, the results are undefined.

Prototype

```c
HasPropertyCharacteristic( PropertyName, Characteristic )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Characteristic</td>
<td>Req</td>
<td>The name of the characteristic that is to be checked. Currently supported values are found below.</td>
</tr>
</tbody>
</table>

The characteristics available are found in the following table. The names are not case-sensitive.

"calculated" or "prefetch"

This characteristic is set when the property does not have a value of its own, but is calculated from other properties on the object.
"default"

This characteristic is set if the value in the property is a default value supplied by erwin Data Modeler.

"hardened"

This characteristic is set if the value in the property has been hardened against change. Currently, this is supported only for certain name properties on logical/physical objects, so this only has meaning when applied to the Name and Physical_Name properties of an Attribute, Default, Domain, Entity, Key_Group, Relationship or Validation_Rule. Future releases of erwin Data Modeler may extend hardening to more property types.

"autocalculated"

This characteristic is set when a property is in an auto-calculate state. Currently, this is supported only for the Cardinality property on the Relationship object. Future releases may extend this to other properties.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The characteristic is not set.

Deprecation Level

Active

/* Indicate if the physical name is hardened. */
ForEachOwnee("Attribute")
{
[HasPropertyCharacteristic("Physical_Name", "hardened")
"Column " Property("Physical_Name") "is hardened\n"
]
}

IncludeFile

Description

This loads the contents of a text file, then parses and evaluates it.

**Note:** The file is expected to contain only TLX code, and the entire contents will be evaluated in one pass. The contents are expected to contain macro block delimiters. Contrast this with the *Execute* macro, which works on a file containing multiple TLX entries and where the entries do not contain macro block delimiters.

Prototype

IncludeFile( FileName )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Req</td>
<td>The name of the file. When specifying a path, remember that backslashes in literals must be escaped.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The specified source file is not found.

Sample

Assume a file, reusable_template.txt, had contents such as the following.
The entity's name is {# Property("Physical Name") #}.

Assume the current context is a table called E_1.

Template

IncludeFile( "c:\reusable_template.txt" )

Result

The entity's name is E_1.

Increment

Description

This macro will increment the value in the specified variable. The variable is assumed to contain an integer value. If it does not, the value is coerced to zero and the increment occurs. If the variable does not exist, it is created first with a value of zero, then incremented.

Prototype

Increment( VariableName )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VariableName</td>
<td>Req</td>
<td>The name of the variable.</td>

Template

ForEachOfType("Entity")
{
  @if( IsModified )
  {
    "Property("Physical_Name")" was modified.
  }
}

Result

E_1 was modified.
IsNotInheritedFromUDD

Description

This macro determines if domain (user-defined datatype) inheritance is present for a constraint. If Property is specified, the macro checks if the specified property is inherited. If Property is not specified, it checks to see if the Check_Constraint_Usage object is inherited.

Since inherited constraints and some properties are not present in the database, this macro allows determinations to be made if DROP statements should be created.

Prototype

IsNotInheritedFromUDD( [Property] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Opt</td>
<td>The type name of the property.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The domain inheritance is not present.

Deprecation Level

Active

Breaking Changes

None

Categories

Sample

Template
/* If the column defines a default for itself, we need to do something. If it picks up the default from a user-defined datatype, we don't. */
[ IsNotInheritedFromUDD
  "exec sp_binddefault " ...
]

Result

The `sp_binddefault` will be emitted for columns that define their own defaults.

**IsOwnerPropertyEqual**

Description

This macro will succeed if the specified property has the specified value on the owning object of the current context object.

Prototype

`IsOwnerPropertyEqual( Property, Value [, NotFoundValue] )`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Value</td>

<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"existing_only"

By default, the presence of a new value or the deletion of an old value will cause the macro to fail. If this option is specified, then the macro will only check to make sure
that the remaining elements are in the same order relative to each other.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The value of the property has not been modified.
- The value of the property has had new elements added or existing elements removed and "existing_only" is not specified.

Categories

- String Macros

Sample

Assume the context is the primary key of an Entity object.
Template

Switch( Left( Property("Key_Group_Type"), "2" ) )
{
  Choose( "PK" )
  {
    "This is a primary key."
  }
  Choose( "AK" )
  {
    "This is an alternate key."
  }
  Default
  {
    "This is an inversion entry."
  }
  Choose( "XX" )
  {
    /* This block will never execute, because a preceding block 
    will always evaluate successfully */
  }
}

Result

This is a primary key.

Less

Description

This determines if one value is less than another.

If the values are being compared as numbers, it assumes that the parameters passed are 
numeric values. In these cases, the macro stops reading a parameter when it encounters a 
character it cannot convert. If no characters are converted, the value is assumed to be zero. 
For example (assuming "ascii" is not specified):

"123"

    123
Prototype

```
Less( LeftString, RightString [, Option1 [, Option2 [, ...]]] )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeftString</td>
<td>Req</td>
<td>The left value in the test.</td>
</tr>
<tr>
<td>RightString</td>
<td>Req</td>
<td>The right value in the test.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td>Opt</td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"ascii"

By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9".

If this parameter is set to "ascii" the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".

"no_case"

If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not less than the second.

{
"Not less on a numeric sort\n"
}
@if( Less( Value("Value1"), Value("Value2"), "ascii" ) )
{
"Less on an ASCII sort\n"
}
@else
{
"Not less on an ASCII sort\n"
}

**Result**

Not less on a numeric sort
Less on an ASCII sort

**LessOrEqual**

Description
This determines if one value is less than or equal to another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

"123"
  123
"123Foo"
  123
"Foo"
  0

Prototype

LessOrEqual( LeftString, RightString [, Option1 [, Option2 [, …]]] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeftString</td>
<td>Req</td>
<td>The left value in the test.</td>
</tr>
<tr>
<td>RightString</td>
<td>Req</td>
<td>The right value in the test.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"ascii"

By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9".

If this parameter is set to "ascii" the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".

"no_case"

If this is set to "no_case" and the values are being compared in an ASCII sort, the
strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not less than or equal to the second.

Sample

In this sample, we want to insert a carriage return every three values. Since we placed the ListSeparator call before the output of the actual value (to avoid a trailing separator), we
need to test based upon a modulo value of '1'...for example, "insert the carriage return before the fourth, seventh, and so on, value."

Template

```plaintext
SetGlobalFlag("Continue")
Loop("Continue")
{
ListSeparator([Modulo(IterationCount, "3", "1") "\n"])
@if ( Greater(IterationCount, "6") )
{
ClearGlobalFlag("Continue")
}
@else
{
IterationCount
}
}

Result

123
456

NotEqual

Description

This determines if one string is not equal to another.

Prototype

NotEqual( LeftString, RightString [, Option] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeftString</td>
<td>Req</td>
<td>The left string in the test.</td>
</tr>
<tr>
<td>RightString</td>

<td>Opt</td>
<td>By default the comparison is case-sensitive. If this parameter is set to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;no_case&quot; the comparison will be done in a case-insensitive manner.</td>
</tr>
</tbody>
</table>
The options available are found in the following table.

"no_case"

By default the comparison is case-sensitive. If this option is set the comparison will be done in a case-insensitive manner.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The two strings are equal.

Deprecation Level

Active

Breaking Changes

None

Categories

- String Macros

Sample

Assume the context is the following table:

![Table]

**Template**

```template
@if( NotEqual(Property("Name"), "e_1") )
{
"Name is not exactly 'e_1'.\n"
}
```
@else
{
"Name is exactly 'e_1'.\n"
}
@if( NotEqual(Property("Name"), "e_1", "no_case") )
{
"Name is not case-insensitively like 'e_1'."
}

Result
Name is not exactly 'e_1'.

ObjectId

Description
This evaluates to the id of the current context object.
For M0 objects (data), this is just an integer that identifies it uniquely.
For M1 objects (metadata), the integer is also uniquely-identifying, but it is a packed combination of an identifier for the source of the metadata and a unique value for the object.
For example, metadata defined by erwin Data Modeler will generally have a value of '1' or '0', erwin Data Modeler NSM metadata will have a value of '4', while UDPs will have a value of '9'.

Note: The values for object ids are stable for a given session of erwin Data Modeler. However, they can change between sessions. If you need an identifier that is stable across sessions, use the value retrieved by:

Property("Long Id")

Prototype

ObjectId( [Option] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td>Req</td>
<td>By default the entire id is returned. A component of the id can be retrieved by using one of the values found below.</td>
</tr>
</tbody>
</table>
"product"

Retrieve just the product identifier portion of the id for an M1 object. This has no effect for M0 objects.

"identifier"

Retrieve just the object identifier portion of the id for an M1 object. This has no effect for M0 objects.

Result

This macro will fail if:

- There is no context object.

Categories

Miscellaneous Macros

Sample

Assume the context object is the Model object.

Template

ObjectId "\n"
ObjectId("product") "\n"
ObjectId("identifier") "\n"
PushMetaObject
ObjectId "\n"
ObjectId("product") "\n"
ObjectId("identifier")

Result
**ObjectType**

**Description**

This evaluates to the type code name of the current context object.

**Prototype**

`ObjectType`

**Result**

This macro will fail in the following circumstances:

- There is no context object.

**Deprecation Level**

Active

**Breaking Changes**

None

**Categories**

**Sample**

Assume the current context is an Entity.

**Template**

```
[Equal(ObjectType, "Entity")
 "This is an entity"
]
```

**Result**
This is an entity

**OnceForObject**

Description

This macro will attempt to set a global flag that is a concatenation of the Label parameter and the context object’s id. The macro will fail if this flag is already set. This allows a template to test for a previous emission of a given template for the object.

Prototype

OnceForObject( Label [, Option] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>Req</td>
<td>A label that will be used to distinguish the particular flag being set.</td>
</tr>
<tr>
<td><strong>Option</strong></td>
<td>Opt</td>
<td>An option keyword. They can appear in any order and are not case-sensitive.</td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"no_set"

If this is present, then only the test of the existence of the flag is performed, but the flag is not set if it is not present.

Result

This macro will fail in the following circumstances:

- There is no context object.
- The flag has been set previously.

- Object Macros

Sample

Assume the current context is an Entity.

**Template**

```java
[OnceForObject("Create Table")
 "First time"
]
[OnceForObject("Create Table")
 "Second time"
]
```

**Result**

First time

**OwnerProperty**

**Description**

This macro evaluates to the string representation of the specified property on the object owning the current context object. A property is identified by its class name as defined in the metadata for erwin Data Modeler.

**Prototype**

```java
OwnerProperty( PropertyName [, Option1 [, Option2 [, ...]]] )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PropertyName</strong></td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td><strong>Option1</strong></td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td><strong>OptionN</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.
"no_load"

By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.

"no_translate"

By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.

"fail_if_empty"

If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.
- The current context object does not have an owning object.

Assume that the `customer_number` column in the following picture is the current context object:

```
CUSTOMER

customer_number: integer NOT NULL

customer_first_name: varchar (20) Null
customer_last_name: varchar (20) Null (IE1)
customer_address: varchar (20) Null (AK1)
customer_city: varchar (20) Null
customer_state: varchar (20) Null
customer_zip_code: varchar (20) Null
email: varchar (50) Null
```

Template

`OwnerQuotedName`
Pad

Description

This macro evaluates to the source string padded to the specified length. The padding will be done by appending Character to the end of the string enough times to reach the desired length. If the source string is longer than the desired length, the entire source string will be returned.

Prototype

Pad( SourceString, Length[, Character] )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SourceString</td>
<td>Req</td>
<td>The source string.</td>
</tr>
<tr>
<td>Length</td>
<td>Req</td>
<td>The desired length of the string.</td>
</tr>
<tr>
<td>Character</td>
<td>Opt</td>
<td>The character used for padding. If this is not specified, a space will be used.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

**Template**

ProperCase("CUSTOMER")

**Result**

Customer

**Property**

**Description**

This macro evaluates to the string representation of the specified property on the current context object. A property is identified by its class name as defined in the metadata for erwin Data Modeler.

**Prototype**

Property( PropertyName [, Option1 [, Option2 [, ...]]] )
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName</td>
<td>Req</td>
<td>The type name of the property.</td>
</tr>
<tr>
<td>Option1</td>
<td>Opt</td>
<td>One or more option keywords. They can appear in any order and are not case-sensitive.</td>
</tr>
<tr>
<td>OptionN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The options available are found in the following table.

"no_load"

By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.

"no_translate"

By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.

"fail_if_empty"

If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.

Deprecation Level

Active

Breaking Changes

The default behavior of this macro has changed since the erwin Data Modeler 7.1 release. The earlier version defaulted to 'no_translate' and 'no_load'.

Sample

The difference in result when using the "no_translate" option is shown in the two example templates below. Assume that the CUSTOMER table in the following picture is the current context object.

```
CUSTOMER

<table>
<thead>
<tr>
<th>Customer Attribute</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>customer_number</td>
<td>integer NOT NULL</td>
</tr>
<tr>
<td>customer_first_name</td>
<td>varchar (20) Null</td>
</tr>
<tr>
<td>customer_last_name</td>
<td>varchar (20) Null (IE1)</td>
</tr>
<tr>
<td>customer_address</td>
<td>varchar (20) Null (AK1)</td>
</tr>
<tr>
<td>customer_city</td>
<td>varchar (20) Null</td>
</tr>
<tr>
<td>customer_state</td>
<td>varchar (20) Null</td>
</tr>
<tr>
<td>customer_zip_code</td>
<td>varchar (20) Null</td>
</tr>
<tr>
<td>email</td>
<td>varchar (50) Null</td>
</tr>
</tbody>
</table>
```

Template

```plaintext
ForEachOwnee("Attribute")
{
  Property("Name") " is "
  Property("Null_Option_Type", "no_translate") "\n"
} Result
customer_number is 1
customer_first_name is 0
customer_last_name is 0
...etc.
Template
ForEachOwnee("Attribute")
```
{  
  Property("Name") " is "  
  Property("Null_Option_Type") "\n"
}

**Result**

customer_number is NOT NULL
customer_first_name is NULL
customer_last_name is NULL
...etc.

**PropertyFrom**

**Description**

This macro evaluates to the string representation of the specified property on the first object in the context stack with the specified type. An object and a property are identified by their class names as defined in the metadata for erwin Data Modeler.

**Prototype**

PropertyFrom( ObjectType, PropertyName [, Option1 [, Option2 [, ...]]] )

<table>
<thead>
<tr>
<th>Parameter</th>

["The value is now: " Value("MyValue")]
Remove("MyValue")
["The value is now: " Value("MyValue")]

**Result**

The value is now: 1

**RemoveInteger**

Description

This removes the specified variable.

Prototype

RemoveInteger( VariableName )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VariableName</td>
<td>Req</td>
<td>The name of the previously defined variable.</td>
</tr>
</tbody>
</table>

Result

This macro will fail in the following circumstances:

- The specified variable does not exist.

Deprecation Level
Deprecated

Breaking Changes

Categories

- String Macros

Sample

**Template**

SetString("MyValue", "One")
["The value is now: " String("MyValue")]
RemoveInteger("MyValue")
["The value is now: " String("MyValue")]

**Result**

The value is now: One

**Repush**

Description

This pushes an object that already exists on the context stack onto the stack again.

Prototype

Repush( Depth )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>Req</td>
<td>The zero-based depth of the object in the context stack. The value provided must be greater than zero (zero indicates the current context object) and less than the size of the stack. The special value of &quot;anchor&quot; indicates that the anchor object should be pushed regardless of the stack's depth.</td>
</tr>
</tbody>
</table>
Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The Depth parameter does not evaluate to a number greater than or equal to '1' and is not the special value of "anchor".
- The depth specified by Depth is greater than the current size of the context stack.

Sample

Assume the context object is the Relationship object in the following illustration. For sake of simplicity in the example, the template assumes that there is only one relation coming into E_2.

![Diagram of E_1 and E_2]

Template

PushReference("Child_Entity_Ref")
ForEachOwnee("Attribute")
{
    ListSeparator("\n")
    @if( IsPropertyNull("Parent_Attribute_Ref")

202
{ 
    Property("Name") " is owned."
} 
@else 
{ 
    Property("Name") " is migrated by "
    Repush("2") Property("Name") Pop "."
} 
}

Result

a is migrated by R_2.
b is owned.

**RepushType**

Description

This pushes an object that already exists on the context stack onto the stack again based upon the class type.

Prototype

Repush( Type )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Req</td>
<td>The type name of the object desired.</td>

Forward Engineering Macros

These macros are usable only in the context of the script generation in Forward Engineering and Alter Script.

This section contains the following topics:

- **ActivateDataPreservation**
- **DataPreservationOption**
- **EndOfStatement**
- **IsAlterScriptGeneration**
- **IsEntityInSubjectArea**
- **IsLastColumn**
- **IsModified**
- **IsSchemaGeneration**
- **NextExistingColumn**
- **Option**
- **OwnerOverride**
- **RecordAlter**
- **RecordCreate**
- **SchemaExecCommand**
- **TempTable**

**ActivateDataPreservation**

**Description**

This macro registers an Entity or Attribute object for the Data Preservation mechanism. The context object is added in the Data Preservation objects list. For the context object, data is prepared in the background to be displayed in the Data Preservation Options dialog.

**Prototype**

```cpp
FE::ActivateDataPreservation
```

**Result**
The macro will fail if:
- The context object is not an Entity or Attribute.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample

**Template**

```plaintext
[IsAlterScriptX

/* Add this entity in the data preservation list. */

[ActivateDataPreservation]

...
```

**Result**

The entity's data will now be preserved across the alter process.

**Description**

This macro inserts a bucket identification token into the script. This token is interpreted by the script processing engine for sorting purposes and then removed. See the document, Editing Forward Engineering Templates.pdf, for a complete description of buckets.

**Prototype**

```plaintext
FE::Bucket( BucketNumber )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
</table>

224
<table>
<thead>
<tr>
<th>BucketNumber</th>
<th>Req</th>
<th>The bucket number.</th>
</tr>
</thead>
</table>

Result

This macro will fail if:

- The required parameters are not supplied.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample

**Template**

FE::Bucket("90")

...

**Result**

There will be no visible effect in the script generated by the FE engine, as the bucket tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows, where \(90\) is the bucket number.

@@\*B=90B*@@

**DataPreservationOption**

Description

This macro is used to get a specific user selection from the Data Preservation Options dialog. The Data Preservation is enabled when there is a drop and re-create of an entity for the Alter Scripts.
The list of options that can be tested is found in the following table.

**WhereClause**
Evaluates to the state of the user-specified "Where Condition".

**DropTempTable**
Evaluates to the state of the "Drop Temp Table" check box.

**PreserveData**
Evaluates to the inverse value of "Do NOT Preserve Data" check box.

**IsDropRecreate**
Evaluates to the value of "Force DROP/re-CREATE Table" check box.

**IsAlterRequired**
Evaluates to the inverse value of "Force DROP/re-CREATE Table" check box.

**RegisterEntity**
This option sets the template flag indicating that the query is generated to transfer the data from the temp table to the new modified table.

Prototype

```cpp
FE::DataPreservationOption( OptionName )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OptionName</td>
<td>Req</td>
<td>The name of the option.</td>
</tr>
</tbody>
</table>

Result

See the above table for explanations of return values.

Deprecation Level
Active
Breaking Changes
None
Categories
Forward Engineering Macros

Sample

Description

This emits the erwin Data Modeler-generated triggers for the context entity.

Prototype

FE::EmitERwinGeneratedTriggers

Result

This macro will fail if:

- The erwin Data Modeler triggers cannot be emitted.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template

FE::EmitERwinGeneratedTriggers

Result

create procedure erwin_raise_except(err int, msg varchar(255))
raise exception err, 0, msg;
end procedure;

CREATE TRIGGER tD_E_1 DELETE ON E_1
EndOfStatement

Description
This macro inserts an end-of-statement token into the script. This token is interpreted by the script processing engine and then removed. This should not be confused with macros like %DBMSDelim that insert end of statement delimiters interpreted by the database.

Prototype
FE::EndOfStatement

Result
This macro always succeeds.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample
Template
FE::EndOfStatement

Result
There will be no visible effect in the script generated by the FE engine, as the end of statement markers are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows.

@@*EOS*@@
**IsAlterScriptGeneration**

Description

This macro succeeds if the process running the script is Alter Script Generation.

Prototype

FE::IsAlterScriptGeneration

Result

This macro will fail in the following circumstances:

- The template is not being expanded as part of Alter Script.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

**Template**

```
[ FE:: IsAlterScriptGeneration

/* Generate alter script-specific stuff */
]
```

**Result**

The Alter Script-specific template will be emitted.
**IsEntityInSubjectArea**

Description

This macro succeeds if current context object is located in the Referenced_Entities_Ref property of the current Subject_Area.

Prototype

`FE::IsAlterScriptGeneration`

Result

This macro will fail in the following circumstances:

- The current context object is not located in the Referenced_Entities_Ref property of the current Subject_Area.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

**Template**

```
[ FE::IsEntityInSubjectArea
/* Only do this if the entity is in the current subject area */
]
```

**IsLastColumn**

Description
This predicate is used by Alter Script processing to determine if the insertion of columns can be done with an ALTER statement, or if the table must be dropped and recreated.

It determines if new Attribute objects have been added to the Entity object owning the Attribute object that is the current context object during the current session.

If new Attribute objects were added, then the macro checks if subsequent Attribute objects were also newly added. The current FE Option Set is used to determine what ordering is being used.

If no Attribute objects were added, the macro returns tests if the current context is the last Attribute based on the settings of the current FE Option Set.

Prototype

FE::IsLastColumn

Result

This macro will fail in the following circumstances:

- Attribute objects were added, but there are Attribute objects later in the current sort order that were not newly added.
- No Attribute objects were added, but the current context object is not the last one.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

**Template**

[FE::IsLastColumn

/* We can use ALTER, so emit construct the statement */
"ALTER TABLE " ... 

]  

**Result**

This particular clause will be emitted.

**IsModified**

**Description**

This macro succeeds functions as does the IsModified macro, except that properties not represented in the database are not considered when testing for modifications.

**Prototype**

FE::IsModified

**Result**

This macro will fail in the following circumstances:

- The current context object is not modified, or is only modified in properties that are not represented in the database.

**Deprecation Level**

Active

**Breaking Changes**

None

**Categories**

- Forward Engineering Macros

**Sample**

The following block will only execute if the object is modified in a database property other than comment.

**Template**
FE::IsModified("Comment")

**IsSchemaGeneration**

**Description**

This macro succeeds if the process running the script is Schema Generation.

**Prototype**

FE::IsSchemaGeneration

**Result**

This macro will fail in the following circumstances:

- The template is not being expanded as part of Schema Generation.

**Deprecation Level**

Active

**Breaking Changes**

None

**Categories**

- Forward Engineering Macros

**Sample**

**Template**

```
[ FE::IsSchemaGeneration

/* Generate forward engineering script-specific stuff */
]
```

**Result**

The Forward Engineering-specific template will be emitted.
**NextExistingColumn**

Description

This macro is used by the Alter Script mechanism for databases that allow the creation of a column in the middle of a table. It evaluates to the name of the next pre-existing Attribute object after a newly-created Attribute. The current FE Option Set is used to determine the sort order.

Prototype

FE::NextExistingColumn

Result

This macro will fail in the following circumstances:

- There is not a succeeding pre-existing Attribute object.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

**Template**

...  
"ALTER TABLE  "  
...  
["\r\n" "BEFORE " FE::NextExistingColumn]  
...
Result
This particular clause will be emitted.

Option

Description
This predicate tests whether the specified option is turned on in the current FE Option Set. The list of options that can be tested is found in the following table. For a description of what these options control, consult the Help system for the Forward Engineering dialogs.

Prototype

FE::Option( OptionName )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OptionName</td>
<td>Req</td>
<td>The name of the option.</td>
</tr>
</tbody>
</table>

Result
This macro will fail in the following circumstances:
- The option is not turned on.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample

Template

/* Are we generating in physical order? */

[OptionX("ColumnPhysicalOrder")]

ForEachReference("Physical_Columns_Order_Ref")
{
Execute("Column Properties")
Result
The code for generating the columns in physical order will be emitted if you have selected this option.

OwnerOverride

Description
This macro evaluates to the appropriate Owner Override value specified in the Forward Engineering dialog.

Prototype
FE::OwnerOverride( [DefaultToModel [, OwnerLevels]] )

DefaultToModel

Status: Opt
If this value is set to true and no owner override is specified in the Forward Engineering dialog, then the value found in the DB Owner property of the object will be used.

OwnerLevels

Status: Opt
If this is specified, the value will be determined for the owning object this number of levels above the current context object.

Result
This macro will fail in the following circumstances:

- There is no owner override specified and DefaultToModel is not present.
- There is no owner override, DefaultToModel is present, but there is no value specified for the Schema_Name property on the object in the model.
- OwnerLevels is specified and the current context object is not that deep in the model ownership tree.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample
Assume the following table is the current context object. The first example results show what would emit if an owner override of sa2 was in place. The second example results show what would emit if no owner override was in place.

```
sa.E_1

   a
   b
```

Template

```
[FE::OwnerOverride "."] Property("Physical_Name") "\n"
[FE::OwnerOverride("true") "."] Property("Physical_Name") "\n
ForEachOwnee("Attribute")
{
ListSeparator("\n")
FE::OwnerOverride("true , "1") "." OwnerProperty("Physical_Name")
```
Result Example #1
sa2.E_1
sa2.E_1
sa2.E_1.a
sa2.E_1.b

Result Example #2
E_1
sa.E_1
sa.E_1.a
sa.E_1.b

RecordAlter

Description
This macro inserts an FE Record Alter token into the script. This token is interpreted by the script processing engine when creating Alter scripts. Some changes to a model object can be handled by an ALTER statement, while other changes require the corresponding database object to be dropped and recreated. If a change of the first type is processed before a change of the second type, a redundant ALTER statement is generated. To counter this, all ALTER statements are tagged using this macro. When the FE engine processes the script, it examines the entire state of the object and, if another change forces the drop/recreate, eliminates the ALTER statement. These tags are removed from the final script.

Prototype
FE::RecordAlter

Result
This macro always succeeds.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample

**Template**

FE::RecordAlter

...

**Result**

There will be no visible effect in the script generated by the FE engine, as the alter script tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows, where \(189\) is an object's id.

@@*A=189A*@@

**RecordCreate**

Description

This macro will attempt to set a global flag that is a concatenation of the context object's id, the label `Create` and the context object's type name. The macro will fail if this flag is already set. The flag indicates that the object has been created, which allows the post processing to test for and remove any alter statements which may have been generated for the object.

Prototype

FE::RecordCreate
Result

This macro will fail in the following circumstances:

- The flag is already set.

Deprecation Level

Active

Breaking Changes

None

Categories

Forward Engineering Macros

Sample

**Template**

FE::RecordCreate

...

**Result**

No visible result.

**SchemaExecCommand**

Description

This macro inserts an FE Execute Command token into the script. This token is interpreted by the script processing engine when working against a 4GL such as Access or FoxPro in order to construct the commands to modify the database objects via the 4GL's API.

Prototype

FE::SchemaExecCommand( CommandString )

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
</table>

246
**CommandString** | Req | The command string to embed.

Result

This macro always succeeds.

Deprecation Level

Active

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

**Template**

FE::SchemaExecCommand("Create Access Field Start")

**Result**

There will be no visible effect in the script generated by the FE engine, as the schema execution tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows.

@@*SECreate Access Field StartSE*@@

**TempTable**

Description

This evaluates to the name of the temporary table that the Data Preservation option of Alter Script has created.

Prototype

FE::TempTable
Result

This macro will fail in the following circumstances:

- Alter Script has not constructed a temporary table.

Deprecation Level
Active

Breaking Changes
None

Categories
- Forward Engineering Macros

Sample

**Template**

... 
"INSERT INTO " ...

...
" SELECT " ...

...
" FROM " TempTable
